## LIST OF APPENDICES

APPENDIX A: Supplementary Data Tables
APPENDIX B: Unit Root Tests
APPENDIX C: The Bulgarian Banking System, 1987-1997
APPENDIX D: Some Stylized Facts
APPENDIX E: Summary Charts
APPENDIX F: Interest Rate Policy and Stabilization, Addendum to theLiterature Review
APPENDIX G: Ratio of Domestic to Foreign Currency Holdings, Optimality Conditions
APPENDIX H: Political Instability in Bulgaria, 1990-1997
APPENDIX I: References and Data Sources

## APPENDIX A: Supplementary Data Tables

Table A-1: Money Supply and Components, 1991-97
Table A-2: Money Multiplication, Refinancing and Domestic Credit, 1991-1997
Table A-3: Real GDP Growth in Transition Economies, 1991-1997
Table A-4: Consumer Price Inflation in Transition Economies, 1991-1997
Table A-5: Broad Money Growth in Transition Economies, 1991-1997
Table A-6: Dollarization Ratio in Transition Economies, 1991-1997
Table A-7: Growth in Domestic Credit and Central Bank Refinancing, January 1996March 1997, Lev Only

Table A-8: Growth in Domestic Credit and Central Bank Refinancing, January 1996March 1997, Foreign Currency

Table A-9: General Government Budget, Cash Basis Reporting, 1991-96
Table A-10: Gross Foreign Debt and Indicators, 1991-96
Table A-11: Bulgaria's Balance of Payments, 1991-96
Table A-12: Issues of Bad Debts Government Bonds, 1991-1995
Table A-13: Structure of Domestic Government Debt
Table A-14: Non-performing Loans and Liquidity Crises in a Sample of Transition Economies, 1990-1997

Table A-15: Fiscal and Quasi Fiscal Costs of Banking Crises in a Sample of Transition Economies, Percent of GDP

Table A-16: Fiscal Expenditures due to Banking Crises and Fiscal Deficit in a Sample of Transition Economies, Percent of GDP, 1991-1997

Table A-17: Augmented Dickey-Fuller Tests (No Intercept, No Trend)
Table A-18: Augmented Dickey-Fuller Tests (Intercept, No Trend)
Table A-19: Augmented Dickey-Fuller Tests (Intercept, Trend)
Table A-20: The Bulgarian Banking System, 1987-1997

* Broad money includes currency outside banks, domestic currency deposits (demand, time and savings deposits), and foreign currency deposits in domestic banks.
** The dollarization ratio is the ratio of foreign currency deposits to broad money.
No data available for C.I.S. countries in 1991; data partially available for Central and Eastern Europe and the Baltics in that year.

# APPENDIX C: The Bulgarian Banking System, 1987-1997 

Table A-20: The Bulgarian Banking System, 1987-1997

| Period | Banking Sector Developments |
| :--- | :--- |
| Before 1987 | Three banks: Bulgarian Bank of Foreign Trade (foreign exchange operations), <br> State Saving Bank (household deposits, housing loans), and Bulgarian National <br> Bank (currency issuance, commercial and investment banking) |
| 1987 -1990 | Introduction of two-tier banking system: one central bank (BNB), 7 specialized <br> banks, and 59 small (state-owned) commercial banks |
| 1991 | First private banks licensed |
| 1992 | Government set up Bank Consolidation Company (BCC) to merge, strengthen, and <br> supervise state-owned banks for privatization. <br> By the end of 1995: 10 state banks, 29 private banks, 6 foreign banks. |
| 1994 | Introduction of ZUNK bond program to recapitalize insolvent banks. <br> Limited impact on banks' long-term viability due to severe design flaws (e.g., <br> yield below market rate). |
| $1994-1995$ | Increasing solvency and liquidity problems. <br> Heavy refinancing of illiquid institutions by BNB and SSB. |
| November 1995 - <br> December 1995 | Interdepartmental committee (BNB-BCC) established. Substantial provisioning <br> and disclosure requirements imposed upon banks. Large number of banks (state- <br> owned and private) found "technically bankrupt." <br> Limited BNB actions. Why? Absence of bankruptcy laws and fear of disrupting <br> payments system (stronger banks were too small and too specialized). <br> Plans to introduce limited deposit insurance announced in December. |
| December 1995 - <br> April 1996 | Public awareness of the crisis: lines outside banks and serious liquidity shortages <br> (especially in foreign currency). Widespread rumors of bank failures. Overall: <br> rapid loss of deposits and financial disintermediation. <br> BNB injected BGL 25 billion (16 percent of reserve money); SSB increased inter- <br> bank lending by BGL 12 billion (8 percent of reserve money). |

Table A-20 Continued

| Period | Banking Sector Developments |
| :---: | :---: |
| May 1996 | Widespread deposit runs. New legislation passed to allow bank closures. Two large banks closed (First Private Bank and Mineralbank), along with three smaller banks. <br> Limited demonstration by depositors: domestic currency deposits available at SSB after two weeks; foreign currency deposits transferred to Postbank, to be paid in four installments over two-year period, or immediately in Lev. <br> Severe lending restrictions placed on remaining weaker banks (through memoranda of understanding with BNB). Limitations on BNB unsecured refinancing, and commitments to enhance supervisory standards under program sponsored by IMF. |
| $\begin{array}{lll} \hline \text { May } 1996 & - \\ \text { July } 1996 \end{array}$ | Stabilization of deposits through July 96. Significant reduction in pressures on BNB and SSB. Some problems remained: <br> - Closure decisions repeatedly postponed: BNB assessment of banks' financial condition contested in Courts; <br> - Limited ability of government to handle crisis more comprehensively (e.g., through massive bank recapitalization) and loss of credibility. |
| July 1996 - Early <br> September 1996 | Provision of substantial liquidity by BNB, without equivalent sterilization. <br> Many undercapitalized banks still in operation: negative cash flow, mounting uncollected interests, further decline in quality of banks portfolio. Widespread disintermediation: significant outflows of domestic and foreign currency deposits from almost all banks. Resurgence of lines outside banks and liquidity shortages. <br> Banking crisis "spilled over into public debt market:" decline in banks participation in government paper market (preference for domestic and foreign cash). <br> Significant delays in payments system: contagion to stronger banks. By early September, public expected new wave of bank closures. |
| $\begin{array}{ll} \text { Late } & \text { September } \\ 1996 & \text { - October } \\ 1996 & \end{array}$ | Comprehensive and wide-ranging restructuring of banking sector. <br> - Nine banks under conservatorship on September 23, 1996. Significant increase in basic interest rate. Deposit insurance payments deferred until banks declared bankrupt by Courts. <br> - October: two stronger banks subject to runs, following rumors of account shifting by Customs Services. $\$ 23$ million worth of foreign currency deposits withdrawn (1 percent of reserve money). <br> - To restore confidence in remaining banks: huge liquidity injections by BNB (Lombard window first; purchase of ZUNK bonds later). Why? Announcement that second wave of bank closures was "final" to restore confidence. |
| November 1996 | No insolvent banks in the system (one state bank extremely vulnerable). End of interventions: inflationary pressures, emerging political crisis, debate about currency board. <br> Stabilization of banking system: exchange rate revaluation gains, high domestic |

| Period | Banking Sector Developments |
| :--- | :--- |
|  | interest rates, increased banking activity due to "flight to quality." |
| December 1996- <br> February 1997 | Hyperinflation eroded liabilities of banking system and made currency board <br> feasible. <br> New government and restored confidence: increase in market value of state bonds <br> and rapid improvement of banks' balance sheets. |

## APPENDIX D: Some Stylized Facts

The purpose of this Appendix is to highlight key events and developments in Bulgaria's financial crisis. Summary charts used in the discussion are provided in Appendix E.

## The Bulgarian Business Cycle

In the early part of the nineties, the Bulgarian economy went through periods of relative calm followed by episodes of turbulence, or extreme turbulence. This is illustrated by the daily depreciation rate of the Lev, in Figure A-1 in Appendix E. Three regimes can be identified: calm (1992-93, and mid-94 to mid-95), turbulence (early-94 and 1996), and extreme turbulence (1997). ${ }^{206}$ The regime shifts appear to have coincided with changes in the interest rate on domestic money and/or expected changes in the level of foreign exchange reserves associated with either large forthcoming foreign debt payments, or a deterioration of the country's relationships with the IMF and the World Bank, jeopardizing the inflow of foreign capital. During periods of calm, real money holding was relatively stable, implying that money balances and the price level grew approximately at the same rate. The exchange rate was also stable, sometimes even more so than the price level, leading to a real appreciation of the Lev. During periods of turbulence, the exchange rate and the price level both jumped abruptly (after depletion of the foreign exchange reserves), while

[^0]real money holding faltered. Turbulence episodes were also preceded by, or associated with, large increases in the financing requirements of the government budget; fiscal deficits exceeded ten percent of GDP in both 1993 and 1996.

## Real Sector Losses and Monetary Instability

Given the relationships between the government budget, the central bank, the banking system, and the public and private enterprise sectors highlighted in the paper, the financial crisis in Bulgaria could be interpreted as the collapse of a statewide pyramid scheme. This is explained below.

The banking system initially served as a simple "interface" between households and state owned companies: households held domestic currency in bank deposits; commercial banks invested the proceeds of these deposits into state firms. The decapitalization of state firms (through various forms of asset stripping) produced a fall in output, leading to financial losses. These losses were transferred to commercial banks through interest payment arrears and default on loan repayments. They were eventually fiscalized through the conversion of commercial banks' bad loans into government debt (the ZUNK bond program). The inflationary pressures associated with servicing the government debt were initially contained by relatively high nominal interest rates on money, and a stable exchange rate, both leading to stable money demand. As structural reforms were delayed and decapitalization intensified, commercial banks continued to experience difficulties. They were kept afloat by repeated liquidity injections (central bank refinancing), and by further measures to transfer the bad loans burden into the government's hands. As inflationary pressures intensified, the central bank had to increase interest rates to sustain money demand. This increase had a perverse effect on both the banking system and the
government budget. At some point, the servicing of government debt itself necessitated liquidity injections by the central bank (either through direct central bank credits, or through large loans to commercial banks investing the loan proceeds into government debt).

In a sense, the government as a whole (government plus central bank) was engaged in a "Ponzi Game" through i) the failure to pass structural reforms and adopt strict bankruptcy laws; ii) the continued support of ailing banks and accumulation of domestic debt to absorb and conceal real losses; and iii) increases in nominal interest rates to help support money demand. Within this partial framework, the crisis arouse from the simple failure to recognize, and eliminate, financial losses early.

## Budget Deficit Financing

The consolidated government had four options to finance its deficit: the use of foreign funds (received from international financial institutions or commercial banks), privatization proceeds, the issue of government securities, or money printing (seignorage). For Bulgaria, only two of these options were available during the crisis years: government debt and money printing. The third option (debt financing) necessitated a relatively healthy banking system, as commercial banks were the primary holders of Treasury bonds. The fourth option (money printing) also necessitated a stable banking system (and high nominal interest rates on Lev deposits) to support money demand and limit the inflationary pressures associated with the policy. ${ }^{207}$ Both options became rapidly unsustainable as confidence in the banking system crumbled.

[^1]
## Foreign Exchange Reserves and Stabilization

As shown in Figure A-2, between January 1993 and December 1997, inflation accelerated whenever the foreign exchange reserves of the BNB fell below $\$ 600$ million. After the depletion of reserves, the inflation rate significantly exceeded the rate of growth of broad money, leading to a rapid reduction of real money balances. Through the period, nominal money growth exceeded inflation (implying remonetization of the economy) in only two occasions: from January through August 1995, and after March 1997. In both instances, the economy had gone through a severe demonetization associated with accelerating inflation in the preceding months.

Ignoring foreign debt payments and foreign financing, changes in foreign exchange reserves are an indicator of foreign exchange market pressures (under a fixed or managed exchange rate regime). As can be seen on the chart, monetary instability surfaced in the summer of 1993 (July), leading to the currency crash of March 1994, and in late 1995 (November) leading to the collapse of May 1996. In both cases, however, there were no signs of accelerating tensions (faster loss of reserves) as foreign exchange reserves approached the $\$ 600$ million threshold. This weakens the hypothesized link between foreign exchange reserves and households' expectations, and provides little evidence for a so-called "speculative attack" on BNB's reserves. ${ }^{208}$

[^2]
## Foreign Currency Deposits and Money Balances

The U.S. dollar value of broad money, broken down into its main components (currency in circulation, Lev deposits and foreign currency deposits) is shown in Figure A-3. Lev money in dollar terms (at market exchange rate) declined rapidly after November 1995. By the end of 1996, foreign currency deposits represented about half of broad money, and nearly two-third ( 65 percent) by the end of January 1997. As shown in the chart, in spite of the banking crisis, domestic currency in circulation (and the ratio of Lev currency to Lev deposits) did not increase that much through 1996, since a large portion of withdrawn bank deposits were converted directly into foreign cash.

As can be seen in Figure A-4, both foreign currency deposits (in U.S. dollars) and real Lev deposits started to fall in late 1995. This suggests that the instability in money demand (Lev) was due primarily to the banking crisis and not, in particular, to interest rate differentials between Lev and foreign currency deposits. The difference with the early 1994 currency crisis is striking, as foreign currency deposits grew continuously through most of 1994. In 1996, the run on commercial banks was associated with a run on the domestic currency (a flight from the Lev) because foreign cash provided the only "safe" hedge against inflation. In this line of thoughts, banking crises end up in a currency crisis, whenever holders of domestic currency expect an acceleration of inflation. Bulgarians expected a boot of inflation precisely at that time for various reasons, including i) poor economic performances through the year and cost-push inflation; ii) large banking sector liabilities, and lack of non-inflationary sources of budget deficit financing; and iii) pressures on the exchange rate, given the level of foreign exchange reserves and forthcoming foreign debt payments.

## Refinancing, Domestic Credit and Money Growth

As shown in Figure A-6, BNB refinancing increased steadily from January 1994 through December 1996 (with few interruptions highlighted in Chapter 3). In 1996, most of the loans extended by the BNB were used by distressed commercial banks to service their obligations towards depositors (as deposit withdrawals intensified), and fueled the attack on the Lev. The rapid growth of domestic credit (in Lev) in July 1996 and between November 1996 and January 1997 resulted from large BNB credits to the government budget during these months. Nominal growth of broad money is shown in Figure A-7. A significant portion of nominal money growth in mid-to late 1996 was due to the depreciation of the Lev and the valuation of foreign currency deposits.

## Change in Interest Rates and Foreign Exchange Market Instability

The annual basic interest rate and foreign exchange reserves of the BNB, and the monthly depreciation rate of the Lev are depicted in Figure A-8. The emergence of foreign exchange pressures in the summer of 1993 coincided with reductions in the basic interest rate, leading to ex-post interest rate differentials favoring foreign currency deposits through most of 1994. The repeated increases in the basic interest rate through 1994 did not help restore the confidence in the Lev, as foreign exchange reserves remained low and foreign currency deposits increased steadily, resulting in a minor currency crash in August-October 1994.

Reductions in the basic interest rate in the summer of 1995 were also accompanied by limited tensions in the foreign exchange market in the early fall
(although the reduction in reserves between June and October 1995 shown in the graph, is not due to interventions by the BNB). The rapid depletion of foreign exchange reserves after November occurred three months after the change in interest rate and, again, appears to have been precipitated primarily by problems in the banking sector. Increases in the basic interest rate after January 1996, when foreign exchange reserves were low and the banking crisis in full swing, were totally ineffective in stabilizing the foreign exchange market (although it is hard to say what would have happened without them!), with the exception of the large increase of September 1996, which again came with a series of other restrictive measures.

## The February 1997 Near-Hyperinflation

The rapid depreciation of the Lev and the acceleration of inflation in late 1996 are fairly well understood; the dramatic plunge of the Lev and associated price increase of February 1997 are not. There was clearly overshooting, a panic among holders of domestic money at that time: i) the Lev appreciated immediately after the trough of mid-February, bringing the exchange rate from BGL 2,936.7 for one US dollar on February $12^{\text {th }}$, to BGL $2,045.5$ at the end of the month; ii) the worst of the currency crash occurred precisely at the peak of the political crisis (although determining exactly when that peak was is highly subjective); and iii) the peak exchange rate was about twice the post-currency board "equilibrium" exchange rate (BGL1,000 for one Deutsch Mark; about BGL 1,700 for one US dollar). ${ }^{209}$

# APPENDIX F: Interest Rate Policy and Stabilization, Addendum to the Literature Review 

#### Abstract

Calvo and Végh (1995) analyze the use of high interest rates in fighting inflation and defending the exchange rate. They first observe that in many chronicinflation countries (such as Argentina, Uruguay, and Brazil in the 1980s), this policy was implemented by paying interest on a fraction of the money supply (time deposits of short maturity or even demand deposits). In those countries, nominal interest rates were kept high in order to make domestic currency denominated assets more attractive, and thereby reduce immediate inflationary and/or exchange rate pressures. In Calvo and Végh's model, a perfect foresighted consumer, in a small open economy with fully flexible prices, arbitrages between consumption, cash and demand deposits to maximize lifetime utility. There is no banking system. The government controls the interest rate on demand deposits and the rate of growth of total liabilities (cash plus demand deposits). The composition of its liabilities is demand-determined. Within this framework, the authors demonstrate that a permanent rise in the deposit rate provokes a once-and-for-all reduction in the price level, but has no effect on either consumption or the inflation rate (page 59). A temporary increase in the deposit rate generates an initial fall in the price level, but the inflation rate increases exponentially afterward (as long as the hike is maintained). The domestic currency appreciates on impact, but begins to depreciate immediately afterward, and may end up at a more depreciated level than initially (page 63). The authors conclude that paying high interest on

money may in fact exacerbate the "stop-and-go cycles" that often characterize highinflation economies (page 63).

Calvo and Végh (1996) is an extension of Calvo and Végh (1995), in the context of a closed-economy with sticky prices (prices are sticky in the short-run and revised periodically through staggered adjustments). In this framework, a higher interest rate on money does reduce the inflation rate in the short run, but at the cost of a recession. This is true whether the policy is perceived as temporary or permanent. However, when the hike is (perceived as) temporary, the initial reduction in inflation is followed by an upsurge of inflation, over the level prevailing before the policy was implemented (page 1549). The more "credible" is the temporary policy, the larger and the more prolonged is the initial fall in inflation. ${ }^{210}$ In the model, a higher deposit rate increases real money demand. Since real money supply cannot change on impact, aggregate demand must fall to equilibrate the money market: inflation falls on impact. With constant (exogenous) monetary growth, however, inflation must rise over its initial level at some point, to bring real money balances back to their initial (steady state) level, (page 1559).

Lahiri and Végh (1998) investigate the effects of interest rate policy on the occurrence and timing of balance-of-payments crises. They first describe crises $\grave{a}$ la Krugman as cases where the monetary authority remains "passive" when faced with continuously falling foreign exchange reserves. They explore two alternative policies. The first policy consists of announcing an increase in the interest rate paid on domestic-currency-denominated assets in the event of a crisis. If the interest rate is

[^4]raised in such a way that the opportunity cost of holding (domestic) money remains constant, there will be a crisis, but no run. The continued expansion of domestic credit will lead to the depletion of foreign exchange reserves and to the abandonment of the peg but there will be no change in real money demand, i.e. no speculative attack. The second policy consists of raising the interest rate before the crisis in order to increase the demand for money and help slowing down the loss of foreign reserves. In this case, the authors show that a balance-of-payments crisis can in fact be delayed forever. How is this possible? The central bank can delay the crisis "by issuing increasing amounts of interest-bearing debt which is willingly absorbed by the public as a result of higher interest rates" (page 33). ${ }^{211}$ This result however depends on two crucial assumptions: i) the demand for money is never satiated; and ii) money demand becomes more interest-elastic as money holdings rise (Lahiri and Végh recognize that these assumptions are unlikely to hold in practice).

[^5]
## APPENDIX G: Ratio of Domestic to Foreign Currency Holdings, Optimality Conditions

The representative agent chooses an optimal sequence $\left\{c_{t}, m_{t}, d_{t}, m^{*}, d^{*}\right\}$ for $t=0 . . \infty$, to maximize lifetime utility subject to four constraints: a portfolio constraint (Equation (2') in the text), a budget flow constraint (Equation (3')); a cash-in-advance constraint (Equation (4)); and a lifetime resource constraint. ${ }^{212}$

The Lagrangian for this optimization can be expressed as:

$$
\begin{gathered}
L=\sum_{t=0}^{\infty} \gamma\left\{\log \left(c_{t}\right)+\lambda_{t}^{l}\left[a_{t}-m_{t}-d_{t}-m^{*}{ }_{t}-d^{*_{t}}\right]\right. \\
-\lambda^{2}\left[a_{t}-a_{t-1}-q+c_{t}-\left(i_{t-1}-\varepsilon_{t}\left(1+i_{t-1}\right)\right) d_{t-1}-i^{*_{t-1}} d^{*}{ }_{t-1}+\varepsilon_{t} m_{t-1}\right] \quad \text { Equation } A-1 \\
\left.-\lambda^{3}{ }_{t}\left[c_{t}-\left(m_{t}\right)^{\delta}\left(m^{*} t_{t}\right)^{l-\delta}\right]\right\}
\end{gathered}
$$

The optimal solution must satisfy:

$$
\begin{array}{ll}
\partial L / \partial c_{t}=0 \Leftrightarrow 1 / c_{t}=\lambda^{2}{ }_{t}+\lambda^{3}{ }_{t} & \text { Equation A-2 } \\
\partial L / \partial m_{t}=0 \Leftrightarrow \lambda^{3}{ }_{t} \delta\left(m^{*}{ }_{t} / m_{t}\right)^{l-\delta}=\lambda^{l}{ }_{t}+\gamma \lambda^{2}{ }_{t+1} \varepsilon_{t+1} & \text { Equation } A-3 \\
\partial L / \partial d_{t}=0 \Leftrightarrow \gamma \lambda^{2}{ }_{t+1}\left(i_{t}-\varepsilon_{t+1}\left(1+i_{t}\right)\right)=\lambda^{l}{ }_{t} & \text { Equation } A-4 \\
\partial L / \partial d^{*}{ }_{t}=0 \Leftrightarrow \gamma \lambda^{2}{ }_{t+1} \cdot i^{*}{ }_{t}=\lambda^{l}{ }_{t} & \text { Equation } A-5 \\
\partial L / \partial m^{*}=0 \Leftrightarrow \lambda^{3}{ }_{t}(1-\delta)\left(m_{t} / m^{*}{ }_{t}\right)^{\delta}=\lambda^{l}{ }_{t} & \text { Equation } A-6
\end{array}
$$

[^6]$$
\partial L / \partial a_{t}=0 \Leftrightarrow \gamma \lambda_{t+1}^{2}=\lambda_{t}^{2}-\lambda_{t}^{l}
$$

Combining (A-4) and (A-5) yields a standard interest parity condition:

$$
\left(1-\varepsilon_{t+1}\right) i_{t}=i^{*}+\varepsilon_{t+1}
$$

Equation A-8

This is Equation (7) in the text.
Combining (A-3) and (A-6) leads to:

$$
\left(\frac{i^{*}+\varepsilon_{t+1}}{i{ }^{*}}\right)=\frac{\delta}{(1-\delta)}\left(\frac{m^{*}}{m_{t}}\right)
$$

Equation (6) in the text, the optimal currency ratio, is obtained by combining (A-8) and (A-9):

$$
\frac{m_{t}}{m^{*}}=\frac{\delta}{(1-\delta)}\left(\frac{i_{t}}{\left(1+\varepsilon_{t+1}\right) i_{t}}\right)
$$

# APPENDIX H: Political Instability in Bulgaria, 1990-1997 

Table A-21: Governing Bulgaria, Seven Years of Instability, 1990-1997

| Period | Prime Minister | The Government | Main Achievements |
| :--- | :--- | :--- | :--- |

| February 97 <br> - April 97 | Stefan <br> Sofianski, <br> mayor of Sofia | Caretaker <br> Government, UDF <br> aligned | End of fuel shortages, Lev <br> stabilized, inflation brought <br> down, agreement with the IMF. |
| May 97 - <br> December <br> 97 | Ivan Kostov | Anti-communist <br> coalition, led by the <br> UDF | Currency Board in July 1997, <br> economic recovery, important <br> legislation on banking and crime <br> control. |

[^0]:    ${ }^{206}$ See in particular Wyzan (1998) in the literature review

[^1]:    ${ }^{207}$ As in Calvo and Végh (1995); see Appendix F

[^2]:    ${ }^{208}$ Agénor, Bhandari and Flood (1992) for example, note that in a stochastic setting (where agents are only imperfectly informed about central bank policies), reserve depletion should accelerate on the way to the regime change (page 370). With perfect foresight, on the other hand, the path of reserve losses would follow that observed in Bulgaria!

[^3]:    ${ }^{209}$ The currency-board equilibrium exchange rate should be calculated in relation to the level of foreign exchange reserves. Still, Balyozov (1999) estimated that, in February 1997, the Lev was about 60 percent undervalued, relative to its equilibrium.

[^4]:    ${ }^{210}$ Credibility is modeled through a "credibility horizon:" the time at which the hike in the nominal deposit rate is expected to cease.

[^5]:    ${ }^{211}$ As explained in Chapter 3, this is very important for understanding the conditions leading to the collapse of the Bulgarian economy in late 1996 - early 1997.

[^6]:    ${ }^{212}$ Implying, roughly that the agent cannot die in debt. This can be expressed as $\lim _{t \rightarrow \infty}(1+\gamma)^{t} a_{t} \geq 0$
