

Acknowledgements

There are many people who have had an impact on this dissertation; some with their academic guidance, others with their personal support, and many who have given me both.

First and foremost, I am truly grateful to have had Marie Claire Villeval as my supervisor. I cannot thank her enough for always finding the time to discuss my works despite her extremely busy schedule, for giving me the right advices and opportunities throughout my PhD, and most importantly, for her patience with me. I cannot find the right words to express how great an advisor she is. I will only say that she is for me, somewhere between Wonderwoman and Grand Master Yoda.

I would like to express my gratitude to the committee members. I thank David Masclet and Marc Willinger for having accepted to referee my work. I also thank Urs Fischbacher, Simon Gaechter, Guillaume Hollard and Claude Meidinger. It is an honor for me to have this opportunity to discuss my work with them.

This thesis would never have been completed without the financial and human support of several institutions. University Lyon 2 awarded me a thesis grant and gave me the opportunity to start my career as a teacher there. I would also like to thank the Ecole Doctorale de Sciences Economiques et Gestion for their support to PhD students.

Most importantly, I want to thank the Group of Analysis and Economics Theory (GATE). It has been a fruitful environment. I will never forget my years at GATE. I am grateful to the two successive directors, Jean-Louis Rullière and Marie Claire Villeval.

During my PhD, I also benefited from a time of research in CEDEX at the University of Nottingham. During my time there, my knowledge of economics improved greatly because of the high standard of teaching and research. In this regard, I would like to thank Simon Gaechter for his invitation to the University of Nottingham and his availability to discuss my projects while I was there.

I would like to thank all the professors and researchers at the GATE institute, especially Stéphane Robin and Izabela Jelovac, for always being willing to spend time to discuss my research, and for their support.

I would also like to thank Romain Zeiliger and Sylvain Ferriol for designing the software used in the experiments conducted for this dissertation and all the PhD students for research assistance in the laboratory. I am thankful to all the administrative and computing staff at GATE for their logistic and technical support in particular to Nelly Wirth, Dominique Nave, Taï Dao, Bruno Crevat, Sylvain Boschetto, Stéphane Nou, Angélique Brut and Matthieu Neveu.

A special acknowledgement to Béatrice Roussillon and François Poinas who were both unbelievable office mates, colleagues, friends and co-authors. I am indebted to many current and former PhD students for making my time at GATE much more pleasant and unforgettable, especially Carole, Sabrina, Zied, Katia, Julie, Modibo, Cédric and M'Hamet. I would like to give a special thought to BBcarole and Isabelle for their constant presence and support in the last months of this adventure.

I would like to also thank Daniele and Michalis for making my stay in Nottingham an enjoyable one and Carol, my best flatmate, who has been a precious friend, a patient reader and still helps me to improve my English.

Béatrice has been with me every step of this journey, and I feel lucky to have found in her a lifelong friend.

Most importantly, I would like to thank my parents, my sister and my godmother for believing in me, and for always being there.

Finally, I would like to thank my partner, Amaury, and my son, Raphaël, for their patience, their confidence in me and for making my daily life so enjoyable.
